Future of Work & Enterprise Productivity

The problem and the idea

Decisions change. Agent context rarely follows.

A retry limit changes in a meeting. Development and QA still work from the old conversation.

ContextOS keeps accepted decisions, their owners, and the work that used them connected.

Opportunity and differentiation

Approach	Useful for	Missing connection
Documents / wikis	Capturing knowledge	Which run used which revision?
Private agent history	Continuing a task	What changed for other roles?
ContextOS MVP	Reviewed shared decisions	Links revisions to affected work

Our focus: accepted knowledge + exact provenance + change awareness

Features that complete the handoff

Shared knowledge

Context pages, editor and relationship views

Context-aware work

Grounded task outputs and exact source inspection

Team access

Verified sessions, roles and shared storage

Independent reviews

Owner decisions with version and conflict checks

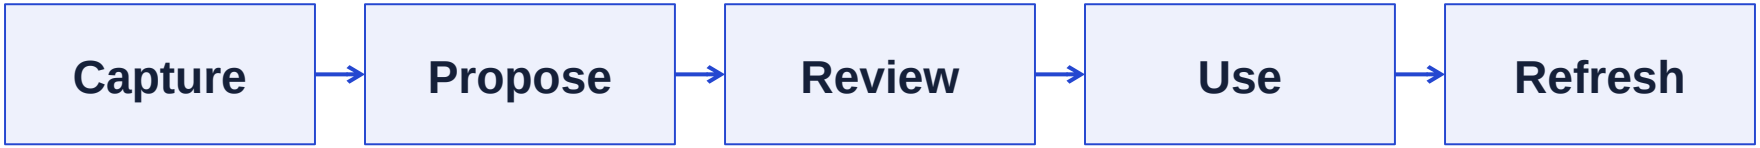

Change awareness

Flag affected runs; preserve original evidence

Guided evaluation

Five personas and twelve step-by-step cases

One change, traced through the work

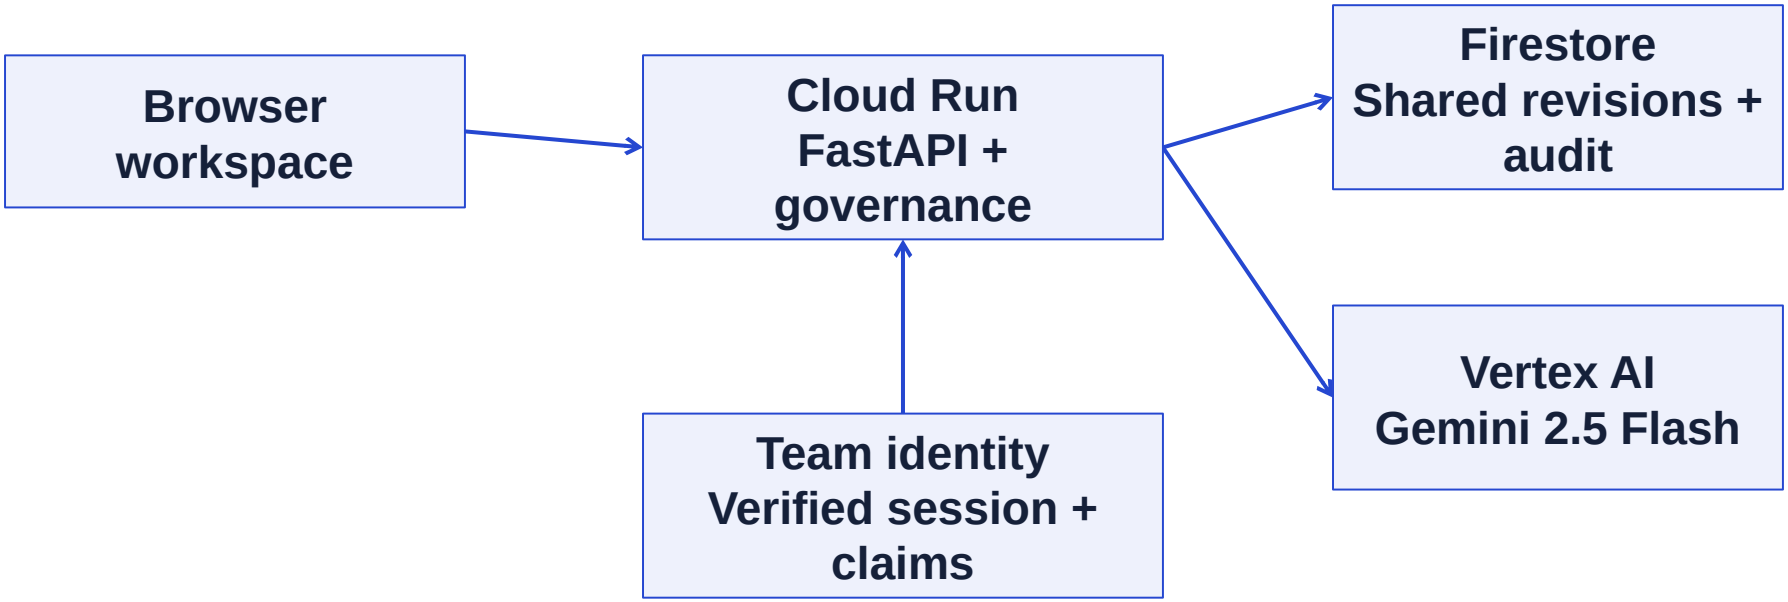

Capture	Propose	Review	Use	Refresh
Notes or an explicit topic	Candidate with source + reason	Independent domain owner	Agent receives accepted revision	Changed sources flag affected runs

Example: retry limit 3 → 2. Old runs retain v1; fresh work uses v2.

Five personas, a clear next action

Persona	Action	Next best move
Product manager	Clarify intent and acceptance	Propose a requirements topic
Architect	Review architecture decisions	Publish an independent proposal
Developer	Plan implementation from sources	Inspect sources or propose a change
QA engineer	Turn constraints into checks	Refresh work after a source update
Security	Inspect policies and restricted context	Review guardrails in its domain

Architecture of the deployed MVP

Backend enforces permissions before retrieval and publication

Technology choices

Experience

HTML, CSS and JavaScript
Responsive, buildless UI
Scoped actions
Source inspector

Application

Python 3.14 + FastAPI
Transactional rules
Google Gen AI SDK

Google Cloud

Cloud Run
Cloud Build
Firestore Native
Team sessions + Vertex AI

MVP cost and operating limits

Costs follow usage

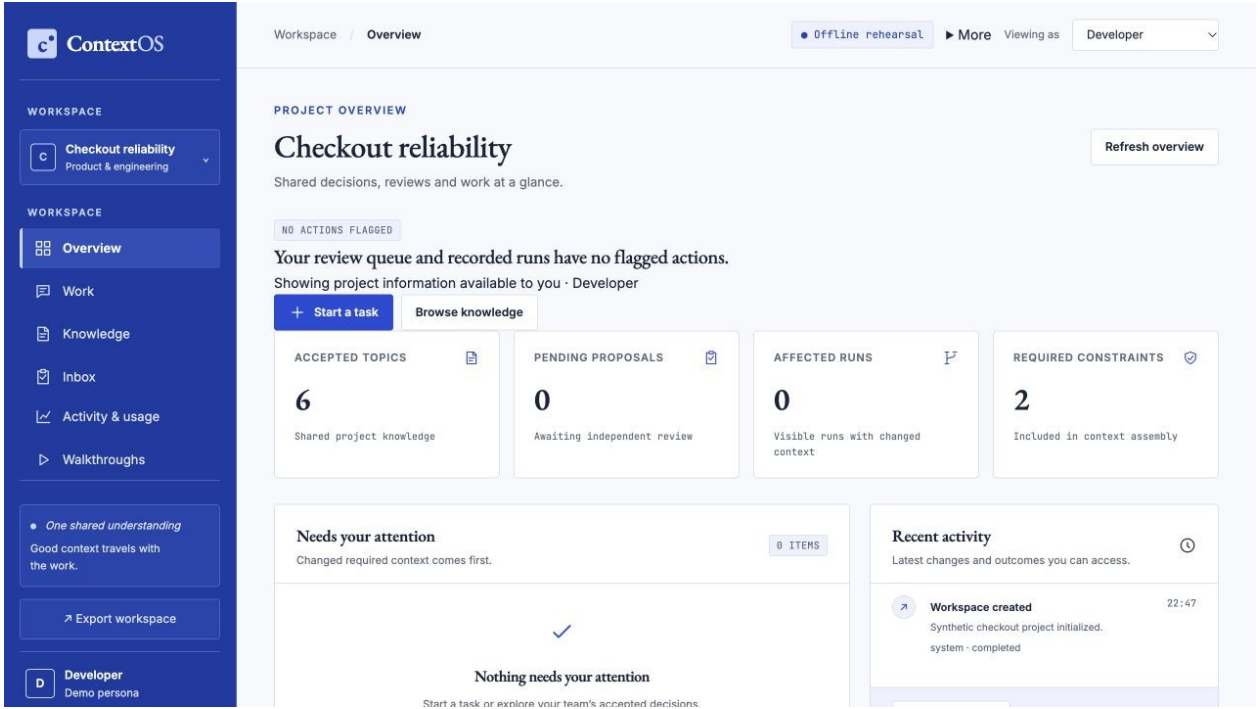

Cloud Run compute and builds
Firestore reads, writes and storage
Model input, output and thinking tokens

Current controls

Scale to zero
2 team instances; 1 demo instance
50 model calls per workspace
750 KB per workspace

No measured monthly bill yet. Public walkthroughs make no live AI calls.

Prototype: an actionable project overview

Inspect priorities

Open the right work

Trace recent actions

Verification evidence

105

Python tests pass

36

JavaScript tests pass

Live

Cloud workflow verified

Verified: two sessions → independent publication → live AI → source update → stale run → refreshed v2 → logout

Functional evidence; productivity gains and load capacity are not measured.

SWOT analysis

Strengths	Weaknesses
Reviewed revisions + provenance Permissions before model context	Lexical retrieval; 750 KB workspace No load or productivity benchmark
Opportunities	Threats
Pilot with small engineering teams IDE and repository integrations	Stale or incorrect source material Adoption friction; tool overlap

Response: prove one team’s handoff value before expanding the platform

Roadmap and success criteria

Now · hackathon MVP

Governed knowledge, scoped actions, live AI and durable cloud deployment

Next · team pilot

Measure handoff repetition, stale-source detection and grounded task quality

Later · expansion

Stronger retrieval, IDE/repository integrations and operational hardening
